Introduction

In today's era, everyone wants convenience and comfort in daily life activities but everywhere it is not possible. Travelling is also a major part of day-to-day activities and in same case also, people want same comfort assistance in whole journey. Taking this statement, we came to the solution that will provide the comfort as well as secure journey provided. Taxi Management System is a web application which lets you book Taxi's for the intercity and intra-city travel purpose using your login credentials and provides you the best service that will make your journey more luxurious. The objective of Taxi Management System is to automate vehicle rental and reservation. So, customers do not need to call & spend unnecessary time in order to reserve preferred vehicle. They can go online and reserve any preferred kind of Taxi they want, which is available at that time.

Purpose

The objective of Taxi Management System is to automate vehicle rental and reservation. So, customers do not need to call & spend unnecessary time in order to reserve preferred vehicle. They can go online and reserve any preferred kind of Taxi they want, which is available at that time. They can go online and reserve any kind of vehicle they want and that is available. The users will be provided with a provision login of the systems so they can check the status of their journey. The taxi driver will be provided with a provision login of the systems so they can check reservation, update their availability status, and also, they can see their daily, monthly, yearly fair earning.

Project Scope

This project's aim is to automate the system, calculating the fare, collecting fare, collecting all necessary information of the client and then serve the client. The data used by the system is stored in a database that will be the centre of all information held clients and employees and the base for the remainder of the process after the initial application has been made. This enables things to be simplified and considerably quickened, making the jobs of the people involved easier. It supports the current process but centralizes it and makes it possible for decisions to be made earlier and easier way.

Goals

The main goal of the system is to automate the process carried out in the organization with improved performance and realize the vision of online booking. Some of the goals of the system are listed below:

- Manage large number of client details.
- Manage all details of clients who registered and requested for getting the service.
- Create employee accounts and maintain the data effectively.
- View all the details of the clients and employees(drivers).
- Showing available vehicles to book for the client.
- Calculating and showing the fare to client before booking.
- Create the statistical reports to facilitate the finance department work.
- Getting the feedback from the client to facilitate future improvement.

Technologies

- Google drive
- Microsoft Windows 7/8/10
- For internal communication with client email is be used.
- HTML: Used for the development and maintenance of the group web page.
- MySQL Database Server

Product Perspective

Figure 1: Model of the System

- The web pages (XHTML) are present to provide the user interface on customer client side. Communication between customer and server is provided through HTTP/HTTPS protocols.
- Web pages will be designed using HTML, CSS, and JavaScript to allow customers and tradespersons to interact and use the website. Customers and tradespersons will communicate with the server through HTTP/HTTPS protocols.
- The Client Software is to provide the user interface on the system user client side and for this TCP/IP protocols are used.
- The database server is for storing the information.

System Interfaces

- Client on Internet: Web Browser, Operating System (any)
- Web Server: Apache, Operating System (any)
- Database Server: MySQL, Operating System (any)
- Development End: HTML, MySQL, OS (Windows), Web server.

Hardware Interfaces

Communication Interface: Client on the Internet will be using HTTP/HTTPS Protocol.

External Interface Requirements

Hardware Interfaces:

1. Server-side hardware
2. Communication hardware to serve client requests
3. Client-side hardware
4. Communication hardware to communicate with the server.

Software Interface

1. Server-side software
 - Web server software
 - Server-side scripting tools: Node.js
 - Database tools: My SQL
 - Compatible operating system: Windows
 - Web browser supporting JavaScript
2. Third Party Software Interfaces
 - Bootstrap

Communication Protocol

1. Server-side protocols
 - HTTP incoming request
 - HTTPS incoming request if secure gateway is implemented
2. Client-side protocols
 - HTTP outgoing request
 - HTTPS outgoing request if secure gateway is implemented

Product Features

Some of the features are identified for the software. They are listed below:

- View Available Vehicles: The client must be able to see all details about the available vehicles without any constraints.
- Calculate Fare: The client must be available to check the fare they should pay for the vehicles.
- Feedback: The administrator should be able to see the feedback given by each client so that he can take appropriate actions for future improvement.

Assumptions and Dependencies

- Vehicles are already purchased and available for use.
- Roles and responsibilities are already established.
- Administrator is already created.

Apportioning of Requirements

It is possible in the future that a few additional features be implemented into this system.

Management System: This will allow the system to manage effectively the other resources in the easiest way.

- **Training Facility**: This will allow effectively train the staffs and improve the quality of service in the company

System Requirements and Analysis:

The following sections will introduce the numerous requirements of the system from the point of view of different users and will introduce a number of decisions that have been made regarding implementation.

These sections also attempt to somewhat describe the role of each user group in the system, discussing their individual roles through the functions they can perform.

User Interface

The user interface for this system will have to be simple and clear. Most importantly, the ages must be easy to read, easy to understand and accessible. The colour scheme should be appropriate to provide familiarity with the Company and there should be no contrast issues.

Client View Functionality:

Registration and Login System: Clients will carry out their own registration, providing the system with a way to associate a user to their request(s). This will enable the system to display personalized information when the user logs in and certain information, such as name and address, to be added to each booking request automatically...

Globalization Support

List of Locale

The system will be in US English, although the application and their options will be in US English. Hence the application and their options are to be in Unicode format.

Content to be localized

The following table lists all the possible area in the system and also mentions whether that area should support Globalization.

Booking System: The booking process will be as straightforward as possible, using an intuitive form layout, with the necessary information being completed in stages.

Update Details: Employees and clients will all have the ability to update their personal details at any time. Clients, however, will also be able to update their booking details. After the user has confirmed the update, an e-mail is dispatched with the original and new details as confirmation. The only time a booking will be locked for editing will be when an employee is employed to serve the client

- **Admin View Functionality:**

Perform weekly roster of Employees: The administrator must be able to select and update the roster a week ahead based on the availability of each employee who further book their individual availability a week ahead.

Print reports annually, weekly, and daily: Providing administrator to print the weekly, annually and monthly reports for his organization based on the time frame selected.

Check feedbacks: The administrator will be able to check the feedback posted by the clients

Manage user portfolio: The administrator will provide access to new users and shall be able to delete the employees no longer working for the organization.

System

Statistics: If the administrator so wishes, they should be able to view statistics gathered by the system regarding bookings. These statistics should be displayed on a page with individually expandable sections, such as extending the number of bookings from the past year to the past two years.

Report Generation: Generate reports based on the selected criteria.

FUNCTIONAL OR SPECIFIC REQUIREMENTS:

The system should satisfy the following requirements:

- **Administrator Aspect**
 - a. Perform weekly roster of Employees
 - b. Print reports annually, weekly, and daily
 - c. Check feedbacks
 - d. Send newsletters
 - e. Manage user portfolio
 - f. Changing the super password.
- **Employee Aspect**
 1. Logging into the system.
 2. To check their rosters.
 3. Maintain daily logs
 4. Select availability.
 5. Check online bookings
- **Client Aspect:**
 1. Make a booking
 2. Check their booking status
 3. Fair calculation
 4. Driver history
 5. Changing password.
 6. Resetting of forgotten password.
- **Analysis**
 1. Authenticating users based on username and password.
 2. Keeping session track of user activity.
 3. Recording client's request for booking.
 4. Checking whether the vehicle is available for booking.
 5. Keeping history of courses bookings.
 6. Keeping record of feedbacks received from the clients.
- **Mailing**
 - a. Temporary password will be mailed to the user incise the user forgets the password.
 - b. Newsletters should go the clients email addresses.
 - c. The client should get notification email of the booking while confirmed.

Performance Requirements

Some Performance requirements identified is listed below:

The database shall be able to accommodate a minimum of 10,000 records of clients.

The software shall support use of multiple users at a time.

There are no other specific performance requirements that will affect development.

Security Requirements

Some of the factors that are identified to protect the software from accidental or malicious access, use, modification, destruction, or disclosure are described below. Specific requirements in this area could include the need to: Utilize certain cryptographic techniques Keep specific log or history data sets Assign certain functions to different modules Restrict communications between some areas of the program Check data integrity for critical variables Later version of the software will incorporate encryption techniques in the user/license authentication process. The software will include an error tracking log that will help the user understand what error occurred when the application crashed along with suggestions on how to prevent the error from occurring again. Communication needs to be restricted when the application is validating the user or license. (i.e., using https).

Portability Requirements

Some of the attributes of software that relate to the ease of porting the software to other host machines and/or operating systems. This may include: Apache is used to develop the Apache is used to develop the product. So, it is easiest to port the software in any environment.

Maintainability

The user will be able to reset all options and all stored user variables.

Reliability

Some of the attributes identified for the reliability are listed below:

- All data storage for user variables will be committed to the database at the time of entry.
- Data corruption is prevented by applying the possible backup procedures and techniques.

Software System Attributes

There are a number of attributes of software that can serve as requirements. It is important that required attributes are specified so that their achievement can be objectively verified. The following items provide a partial list of examples. The input system will allow for inputting numbers, operands, special symbols and letters of the alphabet.

Technologies

This section lists all the technologies for the web-based system.

- PHP/JavaScript scripting for server-side scripting as it has a very strong support for XML and MySQL.
- XML as database format: The database's performance requirements are not very high and the ability to have custom fields in case the application form needs to add more than expected requirement. This is limited in any other database management system where we have to first specify the maximum number of fields.

Software requirements

- Google Chrome
- Microsoft Edge
- Safari or any other modern Web Browser

Hardware requirements

The recommended hardware specified by the respective software would suffice the needs. The memory and processing power needed would increase as the number of users increased. The estimated hardware requirements are as specified:

Server

The minimum hardware as recommended by all of the software required on server side say web server, operating system and development software

- Processing speed of 1.6 GHz
- 1 GB of RAM Network interface

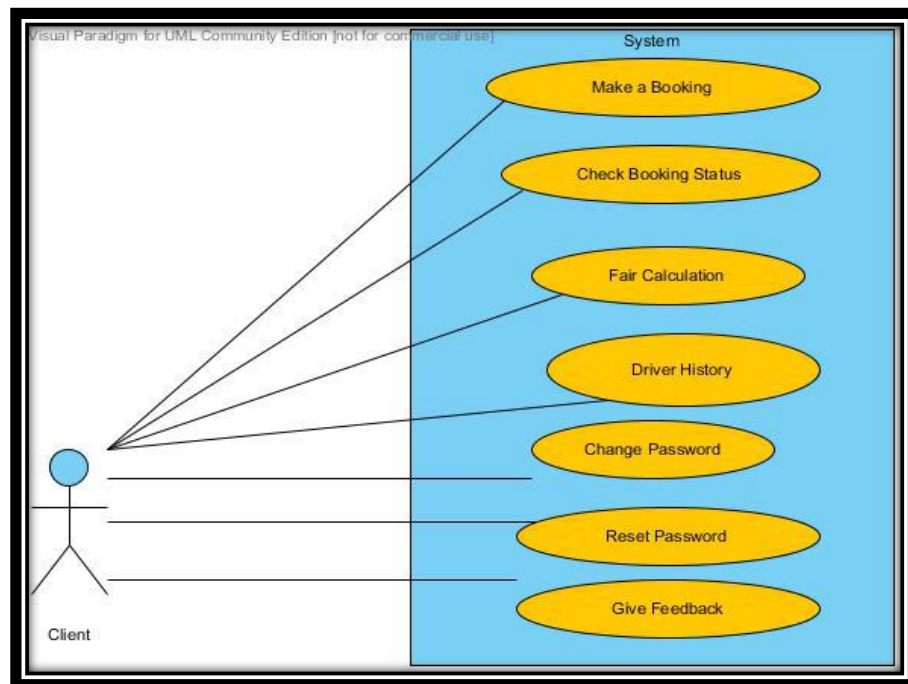

Client

The minimum hardware as recommended by all of the software required on client side say web browser, operating system

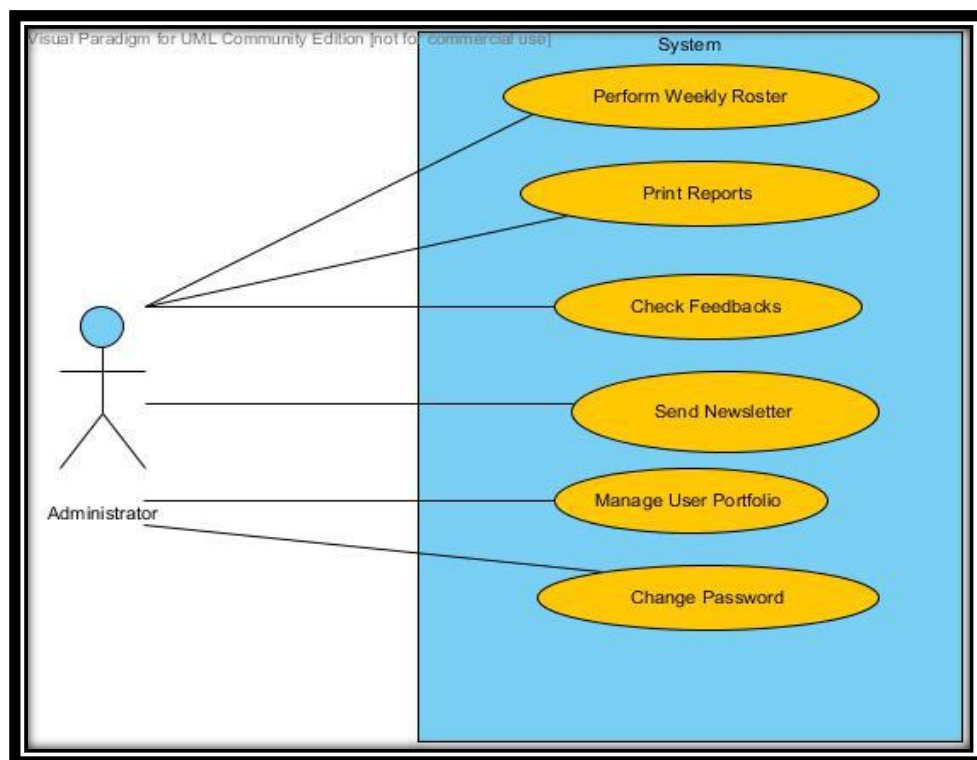

- Minimum hardware depending on the operating system used
- True colour visual display unit
- User peripherals for better interaction
